                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and raf-associated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, pooriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue sequence may be useful for treating inflammatory disorders such as tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          signal transduction; hyperplasia; pulmonary fibrosis; angiogenesis; psoriasis; atherosclerosis; smooth muscle cell proliferation; stenosis; restenosis; inflammatory disorder; tissue graft rejection; endotoxin shock; glomerular nephritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         play a fundamental role in signal transduction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        c-raf is a serine-threonine-specific protein kinase and is thought to

                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                    predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDS following HIV seroconversion. It indicates that increased expression of the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression and enables a variety of new therapeutic interventions in the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for predicting susceptibility to HIV infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interleukin-10 (IL-10) promoter, where the presence of the polymorphism indicates susceptibility to HIV infection or HIV progression. The method provides prognostic information to persons infected with HIV virus and is useful to help select treatments (such as administration of II-10 or gene therapy with II-10). The presence of polymorphism is useful as predictor that very aggressive person. The method is useful for the virus from the infected person. The method is useful for the generation of normograms or other persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Predicting susceptibility to HIV infection or progression useful for selection of therapeutic treatment for persons infected with HIV virus, comprises detecting polymorphism in human interleukin-10 promoter.

CC ARBSSB06 which are involved in regulating the cell cycle The protein and CC DNA sequences have been isolated from Zea mays (corn), and the invention CC also includes oligonucleotides AAC83114 - AAC83139 which are related to the cell cycle polynucleotides. The cell cycle polynucleotide sequences CC are useful for producing transgenic plants such as maize, soybean, CC sunflower, sorghum, canola, wheat, alfalfa, cotton, rice, barley and CC millet with increased levels of cell cycle gene activity and sequences are CC also useful as probes for detecting deficiencies in the level of mNA in CS creening for desired transgenic plants, for detecting mutations in the CC screening for desired transgenic plants, for detecting mutations in the CC activity in screening sasays of compounds, for detecting any number of CC allelic variants, orthologs or paralogs of the gene, and site-directed CC mutagenesis in eukaryotic cells. The DNA sequences are also useful for CC recombinant expression of the encoded plypeptides and as immunogens for CC preparing and screening antibodies. A transgenic plant comprising an CC expression cassette including a cell cycle regulatory gene is useful for cassaying enzyme agonists and antagonists, and as immunogens or antigens CC to obtain antibodies. The antibodies are useful in assaying expression CC levels of cell cycle regulatory gene is useful for CC plants of cell cycle regulatory gene is useful for CC plants of cell cycle regulatory gene is useful for cassaying expression libraries, for identifying and isolating collect acids from expression libraries, for identifying homologues of CC plants of cell cycle regulatory proteins, for identifying homologues of CC plants of cell cycle regulatory proteins for identifying and isolating collected acids from expression libraries, for identifying homologues of collecting collecting cells.

The antisense oligonucleotides have antirheumatic; antiarthritic; immunosuppressive; cardiant and antiinflammatory activity. The antisense oligonucleotides are useful for inhibiting the expression of 938 MAPK in cells or tissues. The oligonucleotides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthritis, or heart disease. The oligonucleotides are also useful for arthritis, or heart disease. The oligonucleotides are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonucleotides inhibit the expression of MAPK. Sequences AAC79480 and AAC79501 represent human p38alpha MAPK and p38beta MAPK cDNA sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for the targeted non-ribosomal synthesis of peptides (I) of required structure, comprising altering one or more A (adenylation) domain-encoding DNA segments (II) that encodes a non-ribosomal peptide synthetase so that the expression product of the altered (II) can produce (I), is new. Alterations in the A-domains are made according to a non-ribosomal code reproduced in the specification. The method is used to synthesize (I) with antibiotic, immunosuppressant, cytostatic, antiviral, antihelminthic, fungicidal or surface-active properties, and to alter specificity and/or activity of known biologically active compounds, e.g. to improve their solubility by replacing hydrophobic amino acids with hydrophilic ones, or vice versa. AAA97960-A97995 represent PCR primers used to illustrate the method of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunosuppressants, using non-ribosomal peptide synthase with targeted modifications in adenylation domains.

                                                                    Query Match
                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological adisorder, a haematopoietic disorder, a hyperproliferative disorder or a disorder, a haematopoietic disorder, a hyperproliferative disorder or a
                                                                                           Sequence
                                                                                                                             developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothioate antisense
                                                                                                                                                                                                                                                                                   Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an analytical support, to which a number of oligonucleotides are fixed. The oligonucleotides are labelled with a fluorescent compound, the fluorescence of which varies when the oligonucleotide hybridises to its complement. The analytical support is useful in hybridisation testing for identification of specific nucleic acids, such as genomic sequencing, detecting mutations or pharmaceutical development. The present oligonucleotide was used to illustrate the
                                                                                                                                         Human; bcl-6; transcriptional repressor; germinal centre formation; Th-2 mediated antibody affinity maturation; apoptosis regulator; chromosome 3q27; lymphoma; acute lymphoblastic leukaemia; post-transplant lymphoproliferative disorder; expression inhibition phosphorothioate; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Support for hybridization analysis of nucleic acids for sequencing techniques, comprises an array of oligonucleotides having a label where the fluorescence changes follow hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analytical support; genomic sequencing; mutation detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligonucleotides were designed to target different regions of the human bcl-6 mRNA, and were analysed for their effect on bcl-6 mRNA levels by quantitative real-time PCR. Bcl-6 (also known as B-cell CLL/ lymphoma 6, zinc finger protein 51 and LAZ3) is a sequence-specific DNA-binding transcriptional repressor. The bcl-6 gene is expressed in germinal centre B- and T- cells and is required for germinal centre modilists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B- and Trocalls and is required for germinal centure formation and Th-2 mediated antibody affinity maturation. Bc1-6 may also play a role in the regulation of apoptosis. The bc1-6 gene is located on chromosome 3927, a region which undergoes a high frequency of translocation events. Such chromosomal translocations can result in aberrant forms of bc1-6, which are strongly implicated in the pathogenesis of several types of lymphoma, and have also been reported in acute lymphoblastic leukaemia and post-transplant lymphoproliferative disorders. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with aberrant forms of bc1-6, such as lymphomas, acute lymphoblastic leukaemia and post-transplant lymphoproliferative

The cot oncogene is also known as Tgl-2 and est. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding cot oncogene. The antisense oligonucleotides are useful for modulating the expression of cot oncogene and for treating diseases associated with expression of cot oncogene, e.g. inflammation, cancer or disorders of the immune system. The antesnse oligonucleotides are also useful for diagnosis or prophylaxis or as research reagents and kits. The present sequence is human cot oncogene antisense oligonucleotide, ISIS This sequence was targetted towards the coding region of human cot oncogene.

The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g. parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g. arthritis) and diabetes. The present sequence is an antisense

                                                                                                                                                                                                                                                                                                                                          В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Characteristics with low levels of haran also been classified as an apoptosis. Cranscottated protein on the basis that such the stabilisation, and shutches the binding of snraps to RNA intron sequences, cand shutches continuously between the nucleus and the cytoplasm acting as a carrier protein for mRNAs. haran Al also participates in telomere concensis, with low levels of haran correlating with shortened continuously between the nucleus and the cytoplasm acting as carrier protein for mRNAs. haran Al also participates in telomere concensis, with low levels of haran correlating with shortened concensis, with low levels of haran correlating with shortened control splicing events, particularly donor splice site selection, haran control splicing events, particularly donor splice site selection, haran control splicated in the process of oncogenesis. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of control splicing actions the transmitted apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Frizzled-related protein (sFRP) gene. It is also useful in antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Secreted Frizzled-related protein; sFRP; chronic bronchitis; asthma; chronic obstructive pulmonary disease; COPD; antisense therapy; mouse; emphysema; reverse transcription PCR; RT-PCR primer; sfrp3 gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibition of apoptosis for the treatment or prevention of obstructive pulmonary disease comprises inhibiting expression of secreted Frizzled-related protein gene in lung cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                D'armiento J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is human secreted Frizzled-related protein 4 (sFRP4) gene specific reverse transcription PCR (RT-PCR) primer. The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted effective related protein (sFRP) gene. It is also useful in antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibition of apoptosis for the treatment or prevention of obstructive pulmonary disease comprises inhibiting expression of secreted Frizzled-related protein gene in lung cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        D'armiento
                                                                                       New mouse multiple tumor suppressor gene, useful for diagnosing or prognosing human cancer or as gene therapy for treating cancer, particularly melanoma, leukemia, astrocytoma, lymphoma or cancers
                                                                                                                                                                                                                                                                                                                                                                            Human; multiple tumour suppressor; MTS1; MTS2; therapeutic; diagnosticancer; gene therapy; melanoma; leukaemia; astrocytoma; glioblastoma; lymphoma; glioma; Hodgkin's lymphoma; chronic lymphatic leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primer RP.2(rev) used in analysis of MTS1 and MTS2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 2; Page 35; 79pp; English.

The sequence represents an FITC (fluorescein isothiocyanate) labeled oligonucleotide complimentary to part of the mRNA encoding the intracellular-adhesion molecule ICAM. The oligonucleotide is included is a composition comprising a fusion protein of herpes virus VP22 protein 159-301 (having the transport function) and a cell-cycle progression regulator (or its DNA) e.g. BH3 or apoptotic proteins. The composition used to reduce the proliferation of cells. The method of making the VP2 containing compositions is used for reducing proliferation of hyperproliferating cells e.g., cancer cells, for manufacturing a medicament reduce or treat cell proliferation e.g., cancer cell proliferation. The method is also used for reducing or treating cell proliferation, in
                                                                                                                                                                                                       Inhibiting cancer cell proliferation by exposing cells to a composition of fusion proteins comprising VP22 polypeptides coupled to cell cycle progression regulators, and further exposing cells to cell death

                                     PCR primers AAH42977-80 were used to amplify k-ras DNA sequences. The primers are used in the method of the invention. The specification describes a method for screening genetic diseases. The method comprises using DNA simply extracted from a biological specimen such as scraped mucosal cells and tissue slide pieces fixed with formalin and embedded in paraffin, and amplifying a target region by polymerase chain reaction (PCR) for direct fluorescence measurement of the additional doublestranded DNA intercalator. The method is used for detecting gene anomaly in e.g. infectious diseases, congenital genetic diseases or cancers, including infection diseases due to human papilloma virus and chlamydia genetic diseases like cystic fibrosis, mitochondrial cerebromyopathy, cancers of cervical cancer and colon cancer, through gene diagnosis in
                                                                                                                                                                                                                                                                 Convenient and cheap microplate fluorescent screening method for detecting gene anomaly in e.g. infectious diseases, congenital diseases or cancers through gene diagnosis in community screen
                                                                                                                                                                                                                                                                                                                                                       Yamaguchi

                                                                                                                                                                                                                                                                                                                                                                                                            against tumour antigens, viral antigens (e.g. herpesviridae, retrand/or orthomycoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The natigaphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                        immune deficiency. The present sequence can also be used to redirect Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 101; Page 43; 338pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes bases in the shape of a string, tape or circular disc on the surface of which a plural number of different ligands are immobilised respectively in pre-determined domains. Also described are devices for detecting the binding between the ligands and receptors and methods for detection using these bases. The methods are useful for detection in biochemical and diagnostic assays. The ligands are immobilised in line, so the user only needs to determine the presence or absence of receptor binding, without further processing. AAH41754 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ovarian tumours or ovarian-derived metastatic tumours in an individual.

CE The diagnostic method involves measuring the level of antileukoprotease (ALP) in a sample (e.g., a blood sample, tissue biopsy or ovarian CE secretion) from an individual. If the level of ALP exceeds the mean basal CE deviations, the individual is likely to have an ovarian or ovarian-CE derived tumour. ALP, also known as secretory leukocyte proteinase (SLP), is a small (approximately 100 amino acids) secreted protease inhibitor CE enzyme, and is also able to inhibit leukocyte elastase, cathapsin G, CE chymotrypsin and trypsin. It is significantly overexpressed in carcinomas and potential tumours of ovarian origin. The invention also provides covarian tumour metastasis, via the administration of ALP. Methods of the covarian and ovarian-derived tumours, particularly low covarian and ovarian-derived metastatic tumours, particularly low covarian and covarian-derived metastatic tumours, particularly low covarian carcinoma, such serous carcinoma, endometrioid carcinoma and clear cell carcinoma. Sequences AAH23897-AAH23850 represent PCR primers used in quantitative pCR primers and covarian and ancesses of ALP manners and ancesses of ALP manners and ancesses of ALP manners and ancesses of ALP and ancesses over an exemplification of the invention to determine levels of ALP manners and ancesses over an exemplification of the invention of determine levels of ALP manners and ancesses over an exemplification of the invention to determine levels of ALP manners and ancesses over an exemplification of the invention to determine levels of ALP manners and ancesses over an exemplification of the invention to determine levels of ALP manners and ancesses over an exemple of an exemple over an exempl

                                                                                                                  Matches
                                                                                                                                                     PCR primers AAC62056-60 were used to amplify nucleic acids encoding the human excitatory amino acid (EAA) 5 receptor. The synthesis this central nervous system (CNS) receptor in vivo is regulated by an editing mechanism. This editing results in the expression from a single human CNS receptor gene of structurally distinct forms of the CNS receptor protein. The specification describes a human EAA4 receptor. The human excitatory EAA4 receptor polynucleotide and the protein it encodes are useful for screening potential therapeutic compounds and selecting drug candidates that interact selectively with edited human central nervous system

The invention also relates to therapy of human cancer which have a mutation in the MTS gene, including gene therapy, protein replacement therapy, and protein mimetics. The MTS sequences are useful for diagnosing predisposition to human cancer or for diagnosing and prognosing human cancers such as melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. They are also used for screening drugs for cancer treatment. The present sequence is P16-specific reverse PCR primer used for amplifying mouse P16beta cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 4 A; 6 C; 6 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel regulatory sequences (A) derived from the control of the immune regulatory sequences (A) derived from the control of the immune of DC (a) and the control of the immune of DC (a) provide specific expression in dendritic cells (DC) and control of the immune of DC (a) antiparasitic, anti-cell sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (i) in vaccines against viruses, bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-cells that contain (A) are useful: (i) in vaccines against viruses, allergies, infections, autoimmune diseases and transplant rejection. They can also be provide specific expression of antigens and immunoregulators of DC; for isolation and identification of cell factors and cis-elements from regulatory sequences that mediate DC-specific expression; to cepulation by providing binding sites in DC. (A) provide DC-specific expression of mucleic acid under their control, allowing a more specific regulation of the immune response and eliminating the long and laborious purification of DC (since a complete leucocyte population may be transformed), including transformation in vitro. This sequence represents a primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁

                                         specifically binds to a human multiple tumour suppressor (MTS). The invention is useful for detecting differences in the absence of MTS peptides, to screen a tissue or to detect mutant MTS gene products. antibodies will immunoprecipitate MTS proteins from solution as well react with MTS protein on Western or immunoblots of polyacrylamide of the state of

                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for screening a candidate therapeutic agent that inhibits kinase enzymatic activity of phosphofructokinase isozyme (iPFK-2). Phosphofructokinase catalyses the formation of fructose 2,6-biphosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPFK-2 activity, an enzyme that is over-expressed by cancerous cells. iPFK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in cellular cytosol as an anti-tumour treatment. The present sequence is buman phosphofructokinase isozyme (iPFK-2) DNA specific phosphorothicate sense oligonucleotide (S-iPKF-2) used in the exemplification of the

Phosphofructokinase catalyses the formation of fructose 2,6-biphosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPFK-2 activity, an enzyme that is over-expressed by cancerous cells. iPFK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in cellular cytosol as an anti-tumour treatment. The present sequence is human phosphofructokinase isozyme (1PFK-2) DNA specific phosphorothioate antisense oligonucleotide (AS-iPKF-2) used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Кеу

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producin recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression

The polynucleotide sequence is useful for producing a mu-type opioid receptor by standard recombinant techniques. The encoded protein is useful for producing monoclonal or polyclonal anti-receptor antibodies and to identify patterns of post-translational modifications and to elucidate associated G proteins. Mu receptor polynucleotides and polypeptides are useful in identifying other receptor subtypes, in screening for new opioid ligands and for understanding mechanisms of

New DNA-peptide nucleic acid chimeras, useful e.g. as antisense ager for treating e.g. cancer, also as diagnostic probes and primers.

Disclosure; Page 24; 54pp; German.

This invention describes novel polyamide-oligonucleotide derivatives (I) and their physiologically acceptable salts of formula F((NNA)-Li)\_g(PNA-Li)\_r(NNA-Li)\_s(PNA)-ti)\_xF' where q, r, s, t = 0 or 1, with the sum of two or more adjacent letters at least 2; x = 1-20; NNA = nucleic acid (such as DNA or RNA or their known derivatives); Li = covalent linkage between DNA and PNA, i.e. a bond or a residue containing at least one atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure containing at least one nucleobase different from thymine; and F, F' = end groups and/or are connected through a covalent bond. The products of the invention have anticancer, antiproliferative, antiviral, hepatotropic and vasotropic activity and can be used for the inhibition of gene expression by antisense, ribozyme, sense, or triple-helix methods, or by binding to proteins (aptamers). (I) are used for treating diseases caused

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC heterogeneous or homogeneous assays, as primers or probes, particularly converse the target is amplified before being detected by hybridization, for city diagnosis of genetic, malignant or pathogen-related diseases (1) retain conventional peptide nucleic acids (PNA), but lack the disadvantages, i.e. have improved cellular uptake, do not aggregate in aqueous solution, and have reduced affinity for purification conventional peptide nucleic acids (PNA), but lack conventions, inc. however dealthinty for purification to aggregate in aqueous solution, and have reduced affinity for purification to segments. When used as probes, (I) convention either DNA or DNA or DNA primers. When used as probes, (I) concogene, also, when used as primers, with the PNA segment at the 5'-end, convention peroduce amplicons resistant to 5'-exonuclease, allowing this enzyme conditional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AAH49208-AAH49264 represent conditions used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                by viruses (human immune deficiency, herpes simplex, influenza, vesicular stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-cell adhesion reactions, for treating cancer, or for inhibiting restenosis, particularly as antisense reagents. They are also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         785/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC comprises: (a) a first database having a list of stability values for cc independent combinations of N(x); (b) a computing unit having a means for cc inputting data comprising N(x), data list, defining a nucleic acid companison, interest to be targeted to provide a second database; and (c) cc comparison, and a stability value of a nucleic acid sequence capable of cc targeting the gene of interest. The method is useful for identifying a cc nucleic acid having a sequence capable of targeting a gene of interest. The method database treatment. The cc method may be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-CC Neighbour Thermal Stability Program can process data for use in cc calculating thermal melting temperatures for phosphorothicate DNA:RNA CC triplex-forming sequences, or antigene oligomers. The present sequence crepresents a DNA 20-mer ASO (antisense DNA closmer) sequence which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLIA1 gene extending in the 5′ to 3′ direction from 78 nucleotides of intron 27 located adjacent exon 28 through the 3′ end of intron 51, where the portion contains an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid having a sequence capable of targeting a gene of interest. These nucleic acids are useful in gene thrapy and disease treatment. The method may be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-Neighbour Thermal Stability Program can process data for use in calculating thermal melting temperatures for phosphorothioate DNA:RNA hybrids. The program can be readily extended to predict the most stable triplex-forming sequences, or antigene oligomers. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             intronic nucleotide and a first and second site, determining the sequence of the portion and comparing the sequence of the portion with the corresponding consensus sequence of the COLIAI gene where a difference between the sequence of the portion and the consensus sequence indicates the presence of the portion and the consensus sequence indicates the presence of the collagen alteration in the subject. The method is used for detecting abnormalities in a COLI or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple capiblyseal dysplasia, osteogenesis imperfecta, shortness of stature and CC low bone density. Identification of an abnormality in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the abnormality. The method is useful for detecting mutations in both the coding and non-coding sequences of any of the COLI or COL9 genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the aggregate composition and the disaggregating agent, as combined preparation for administration of these components, either sequentially or together, a pharmaceutical comprising the aggregate composition and the disaggregating agent, in combination with a pharmaceutical excipient and a cell preparation obtainable by treating the target cells in vitro as cited in the method above. The aggregate composition and as celted in the method above. The aggregate composition and disaggregating agent are useful in the manufacture of a medicament for treating diseases or target cells, and/or preventing cell proliferation and/or killing cells. These compositions, product or pharmaceutical are useful in therapy, particularly for manufacturing medicaments for use in therapy, or as a medicament for delivering molecules to cells to prevent cell proliferation or kill cells. In particular, these may be used for treating psociasis, eczema, skin cancer, restenosis and scarring. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to treat target cells by delivering molecules to the cells and/or preventing cell proliferation and/or killing cells. Also included are a method of treating target cells to deliver molecules to the cells and/or prevent their proliferation and/or kill them comprising: (a) exposing the cells to the aggregate composition cited above, and (b) exposing the cells to the disaggregating agent cited above, which can promote disaggregation of the aggregate composition in cells, where steps (a) and (b) are carried out simultaneously or sequentially, a product comprising the composition and the disaggregation of the aggregate composition in cells.
                                                                                                                                                                                                                                                                                                  Peptide nucleic acid; PNA; cytostatic; virucide; dermatolo antiasthmatic; overexpression; viral infection; vitiligo; pigmentation disorder; asthma; polyamide backbone; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to peptide nucleic acid (PNA) derivatives having at the C-, and optionally N-, terminus one or more phosphoryl groups, at least one of which contains one or more deproteonisable groups, preferably hydroxy or mercapto. These PNAs are useful in the treatment of tumours or any disease associated with (over) expression of particular genes, including viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is a peptide nucleic acid described in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  conventional PCR approaches. In addition to determining specific activity of anti-viral agents, purification of promising anti-viral agents can also be tracked, thus circumvents problems endemic to ex vivo testing, such as drug toxicity and side effects. (M1) is also applied to HHV strains for which complete sequence data is unavailable. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (HHV) by performing informatics analysis of gene sequences from different HHV types or strains (e.g. HHVI-HHV8) to identify target segment (TS), selecting probe and primers capable of directing amplification, amplifying TS, interpolating HHV number by comparing number of amplification cycles (NAC) for detecting TS to NAC to detect known

                                                                                                                                                                                           The invention relates to a marker for testing analogues of vitamin D CC expected to be effective in reducing aberrant activity of vitamin D-CC responsive cell, comprises at least one gene pertinent to the action of CC responsive cell, comprises at least one gene pertinent to the action of CC vitamin D for testing the analogues and determining analogues capable of CC regulating the gene, and is indicative of a chemopreventive or CC chemotherapeutic agent. The invention is useful for testing analogues of vitamin D-responsive cell or for testing analogues of vitamin D suspected to have antiproliferative activity. The invention is useful for reducing aberrant activity of vitamin D-responsive cell, and for treating a disorder characterised by an aberrant activity of vitamin D-responsive cell, where the disorder is selected from cancer, psoriasis, multiple collections, where the disorder is selected from cancer, psoriasis, multiple collectives, osteoporosis, o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the screening of antitumour agents by using the interaction between ARF protein and HK33 (Bousekeeping 33) protein.

Nuclear transport of ARF protein is inhibited by the expression of HK33 gene, and thus p53-dependent transcription is suppressed. In immortalised cells, moreover, the expression of HK33 gene is significantly elevated. The invention provides a method of screening an antitumour agent by using the interaction between ARF protein and HK33 protein. It also provides a method for utilisation of HK33 protein and a gene encoding it in the examination of tumour related disease. The current sequence represents a configuration of tumour related disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated human or mouse targeting peptide useful for targeted delivery of therapeutic agents, for inhibiting angiogenesis, tumor growth or pregnancy, and for inducing apoptosis or weight loss.

(I) is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (I) is also useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents mouse FLIP-c inhibiting chimeric phosphorothicate oligonucleotide having 2, methoxyethyl (2, MOE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (II). (I) has antiinflammatory and anti-tumour activities. (I) is an inhibitor of FLIP-c expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of FLIP-c in cells or tissues, and for treating an animal having a disease or condition associated with FLIP-c. (I) is also useful for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compound that hybridizes and inhibits nucleic acid encoding a natural dominant negative regulator of caspase 8, FLIP-c, useful for preventing or delaying infection, inflammation or tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leukocyte antigen DQB1 locus PCR primer DQB1-ex2F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABQ74294 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SACI gene. A sequence variation of the SACI locus may indicate a
                                           human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene gene. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42927 to ABL42956 represent PCR primers for human maturation/activation DC expression genes, which are used in the exemplification of
                                                                                                                                       The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/ activation DC. Also described are: (1) a protein expressed by the above
                                                                                                                                                                                                                        Disclosure;

The compounds are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The antisense compounds are safely and effectively administered to humans. ABK30509-ABK30586 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compounds targeted to nucleic acids encoding glioma-associated oncogene-1, for modulating the gene expression and treating diseases associated with expression of the oncogene in humans.
                                  ABS77759 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modulating the expression of human glioma-associated oncogene-1. The antisense compounds, particularly antisense oligonucleotides, target and inhibit the expression of human glioma-associated oncogene-1. The antisense compounds are useful for inhibiting the expression of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; glioma-associated oncogene-1 associated disease; infection; inflammation; tumour formation; cvtostatic: antiinflammatorv.
                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense oligonucleotides of the invention which comprise phosphorothicate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2002-138363/18.

                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plague neovascularisation; telangiectasia; haemophiliac joint; plague neovascularisation; telangiectasia; haemophiliac joint;
                                 Immunostimulatory nucleic acid SEQ ID NO: 410

                                                                                                                                alpha and for treating diseases or conditions associated with aberrant expression of Protein Phosphatase 2 catalytic subunit alpha. Such diseases include diabetes and cancer. The antisense oligonuclectides are also useful for diagnostics, therapeutics, and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. They are also useful as research reagents for distinguishing between functions of various members of a biological pathway. ABSG5400-ABSG5477 represent human or mouse Protein Phosphatase 2 catalytic subunit alpha antisense oligonuclectides which comprise a phosphorothioate backbone
                                                                                                                                                                                                                                                                                   The present invention relates to antisense oligonucleotides and methods for modulating the expression of human or mouse Protein Phosphatase 2 catalytic subunit alpha. The antisense oligonucleotides are useful for inhibiting the expression of Protein Phosphatase 2 catalytic subunit
                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides targeted to nucleic acid encoding P. Phosphatase 2 catalytic subunit alpha, useful in treating diseases associated with the aberrant expression of Protein Phosphatase 2
